

## Vector Integral Calculus

### Integration

**Line Integral:** Let  $\vec{F}(x, y, z)$  be a vector function defined on a region of space and let  $C$  be curve in that region, the integral  $\int_C \vec{F} \cdot d\vec{r}$  is called the line integral.

For Riemann Integration,

$\int_{x=a}^{x=b} f dx$  the limits of integration are along the line segment joining  $(a, 0)$ ,  $(b, 0)$ , where  $a < b$ .

Here instead of line, we integrate along the curve  $C$ .

**Circulation:** The line integral around a closed curve  $C$  denoted by  $\int_C \vec{F} \cdot d\vec{r}$  is called circulation of  $\vec{F}$  around  $C$ .

**Eg 1.** Evaluate  $\vec{F} \cdot d\vec{r}$ , where  $\vec{F} = xy \hat{i} + y^2 \hat{j}$  along the triangle  $x = 0$ ,  $y = 0$  and  $x + y = 1$  in the first quadrant.

**Sol.**

$$\int_C \vec{F} \cdot d\vec{r} = \int_{C_1} xy dx + y^2 dy + \int_{C_2} xy dx + y^2 dy + \int_{C_3} xy dx + y^2 dy$$

$C_1$	$C_2$	$C_3$
$y = 0$	$y = 1 - x$	$x = 0$
$0 < x < 1$	$0 < x < 1$	$dx = 0$
$dy = 0$	$dy = -dx$	$1 < y < 0$

$$= \int_{x=0}^1 [x(0)dx + 0] + \int_{x=0}^1 [x(1-x)dx + (1-x)^2(-dx)] + \int_1^0 y^2 dy$$

$$= \int_0^1 (x - x^2 - 1 - x^2 + 2x) dx + \int_1^0 y^2 dy$$

$$\begin{aligned}
 &= \int_0^1 (-2x^2 + 3x - 1) dx - \int_0^1 y^2 dy \\
 &= (-2/3 + 3/2 - 1 - 1/3) = -1/2.
 \end{aligned}$$

**Surface Integral:** Let  $S$  be a closed surface, then the normal surface integral  $\int_S \mathbf{F} \cdot \mathbf{N} ds$  is called the flux of  $F$  over  $S$ .

**Cartesian Form:** Let  $F(r) = F_1 \hat{i} + F_2 \hat{j} + F_3 \hat{k}$  where,  $F_1, F_2, F_3$  are continuous and differentiable functions of  $x, y, z$ . If  $\cos\alpha, \cos\beta$  and  $\cos\gamma$  be the direction cosines of the unit normal  $\mathbf{N}$ , then

$$\begin{aligned}
 \mathbf{N} &= \hat{i} \cos \alpha + \hat{j} \cos \beta + \hat{k} \cos \gamma. \\
 \therefore \int_S \mathbf{F} \cdot \mathbf{N} ds &= \int_S (F_1 \cos \alpha + F_2 \cos \beta + F_3 \cos \gamma) ds
 \end{aligned}$$

But then  $ds \cos\alpha, ds \cos\beta$  and  $ds \cos\gamma$  are the projections of  $ds$  on  $yz, zx$  and  $xy$  planes. If  $dx, dy, dz$  are the differentials along the areas then  $ds \cos\alpha = dy dz; ds \cos\beta = dz dx; ds \cos\gamma = dx dy$ .

$$\therefore \int_S \mathbf{F} \cdot \mathbf{N} ds = \int_S (F_1 dy dz + F_2 dz dx + F_3 dx dy)$$

**Note:** If  $R_1$  is the projection of  $S$  on  $xy$ -plane, then

$$\begin{aligned}
 \int_S \mathbf{F} \cdot \mathbf{N} ds &= \iint_{R_1} \mathbf{F} \cdot \mathbf{N} \frac{dx dy}{\cos \gamma} \\
 &= \mathbf{F} \cdot \mathbf{N} \cdot \frac{dx dy}{|\mathbf{N} \cdot \hat{k}|} \quad (|\mathbf{N} \cdot \hat{k}| = \cos \gamma)
 \end{aligned}$$

$$\text{Equivalently, } \int_S \mathbf{F} \cdot \mathbf{N} ds = \int_{R_2} \mathbf{F} \cdot \mathbf{N} \frac{dy dz}{|\mathbf{N} \cdot \hat{i}|} = \int_{R_3} \mathbf{F} \cdot \mathbf{N} \frac{dz dx}{|\mathbf{N} \cdot \hat{j}|}$$

## Volume Integral

$$\int_{x_1}^{x_2} \int_{y_1}^{y_2} \int_{z_1}^{z_2} f(x, y, z) dz dy dx$$

$$= \int_{x_1}^{x_2} \int_{y_1}^{y_2} \int_{z_1}^{z_2} f(x, y, z) dz dy dx$$
